If you look carefully, you will see 5 tiny waves inside wave i. Of course, the three-wave correction in wave ii is quite clear

Here is one target for an extended wave v, but we will now examine its sub waves to see if we can get additional clues

But before we do that,
observe that if we have
already posted the top of
wave v, then it will mean
wave v = wave iii.
Remember that any two
impulse waves often tend to
equality.

There is a very good chance that wave v top is already posted, as subwave 5 is 50% of 0-3

You have to bear in mind a few important points now: First, when an extended fifth wave ends, we will get a dramatic sell off to minor wave 2 of that fifth wave.

Thirdly, we often get what is known as a double retracement when a fifth wave extends. So if you see that taking the price back to 3.30, use that to position short with more confidence.

PS. Two supports now are 2.93 and 3.025

Finally, no matter what bullish ideas you may read elsewhere, I urge you NOT to play from the long side anymore until AFTER we move down to at least 2.55

Money management is important. So don't expose everything at one go, and get thrown off a good position in case we get the double retracement rally to 3.30. You can't hope to make your entire fortune in one trade!
